Video 32:

<u>Binning and Binarization | Discretization | Quantile Binning | KMeans Binning:</u>

How to Encode numerical features?

Method to do so:

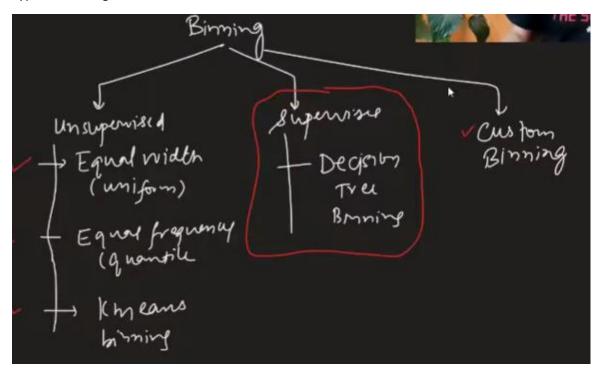

What is Binning?

Discretization is the process of transforming continuous variables into discrete variables by creating a set of contiguous intervals that span the range of the variable's values. Discretization is also called binning, where bin is an alternative name for interval.

Why use Discretization:

- 1. To handle Outliers
- 2. To improve the value spread

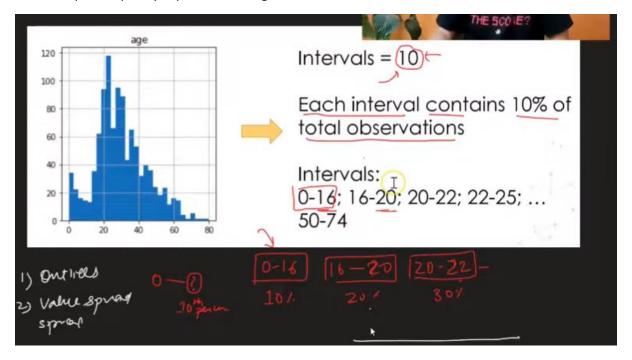

Types of binning?

What is Equal width / uniform binning?

What is Equal frequency / quantile binning?

What is K means binning?

It makes clusters.

Example:

Code link:

https://colab.research.google.com/drive/1S6nWYwPwM5nXIFf0h0pYaaDFhW35kRe2?usp=sharing

Data link:

https://github.com/campusx-official/100-days-of-machine-learning/tree/main/day32-binning-and-binarization

What is binarization? Special case of discretization.

We convert a continuous value into binary.

Video 33:

Handling Mixed Variables | Feature Engineering:

What is mixed data?

In machine learning, mixed data refers to datasets containing both numerical (e.g., age, salary) and categorical (e.g., gender, color) variables. Handling mixed data requires preprocessing techniques like normalization for numerical data and encoding for categorical data, ensuring that both types of features can be effectively used in models.

Example:

Code link:

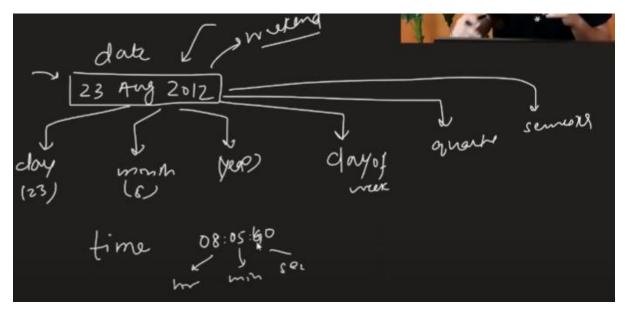

https://colab.research.google.com/drive/1DtLc0S6D1lXGxA_zo0FEHeLbpsiMHxZ8?usp=sharing

Video 35:

Handling Missing Data: Part 1

What to do when we have missing data?

- 1. Remove them not much preferred
- 2. Impute to fill
 - a. Univariate
 - b. Multivariate

Assumptions for CCA:

1. Data will be missing completely at random (MCAR).

Advantages and disadvantages of this method:

Advantage

Preserves variable distribution (if data is MCAR, then the distribution of the variables of the reduced dataset should match the distribution in the original dataset

Disadvantage

- It can exclude a large fraction of the original dataset (if missing data is abundant)
- 2. Excluded observations could be informative for the analysis (if data is not missing at random)
- When using our models in production, the model will not know how to handle missing data

When to use CCA?

- 1. MCAR
- 2. Less than 5% of data is missing

Example:

Code link:

https://colab.research.google.com/drive/11JZVpyUxzHKk Mdec1e-XLdPQo2Xws5K?usp=sharing
